Abstract

The research involved **collecting** and **processing** data from videos of infants **naturally** interacting with their environments. Machine learning models were utilized to understand **motor functions**, categorizing infants' actions into holding, reaching, and grabbing. The concept of Pose was used to estimate **infant joint coordinates**, providing low-dimensional representations. These skeleton-based representations aid in understanding typical infant motor functions.

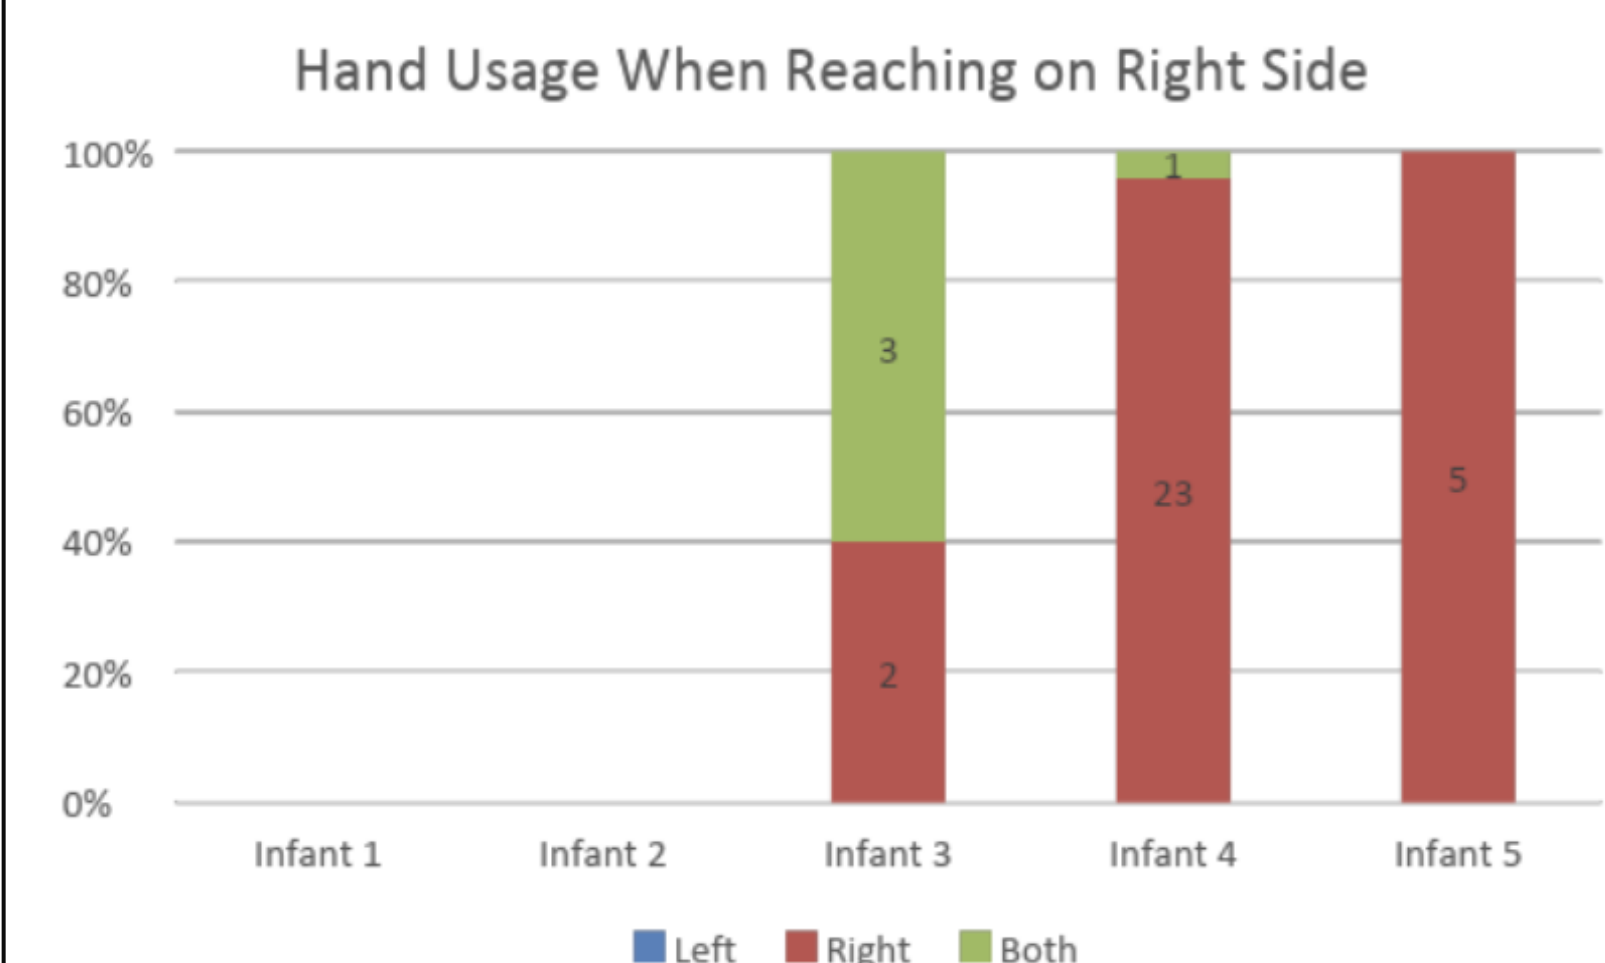

Background

Neurodevelopmental conditions affect nearly **7%** of children in the US, yet only **1/3** of children **under 5 years old** receive recommended developmental screenings.

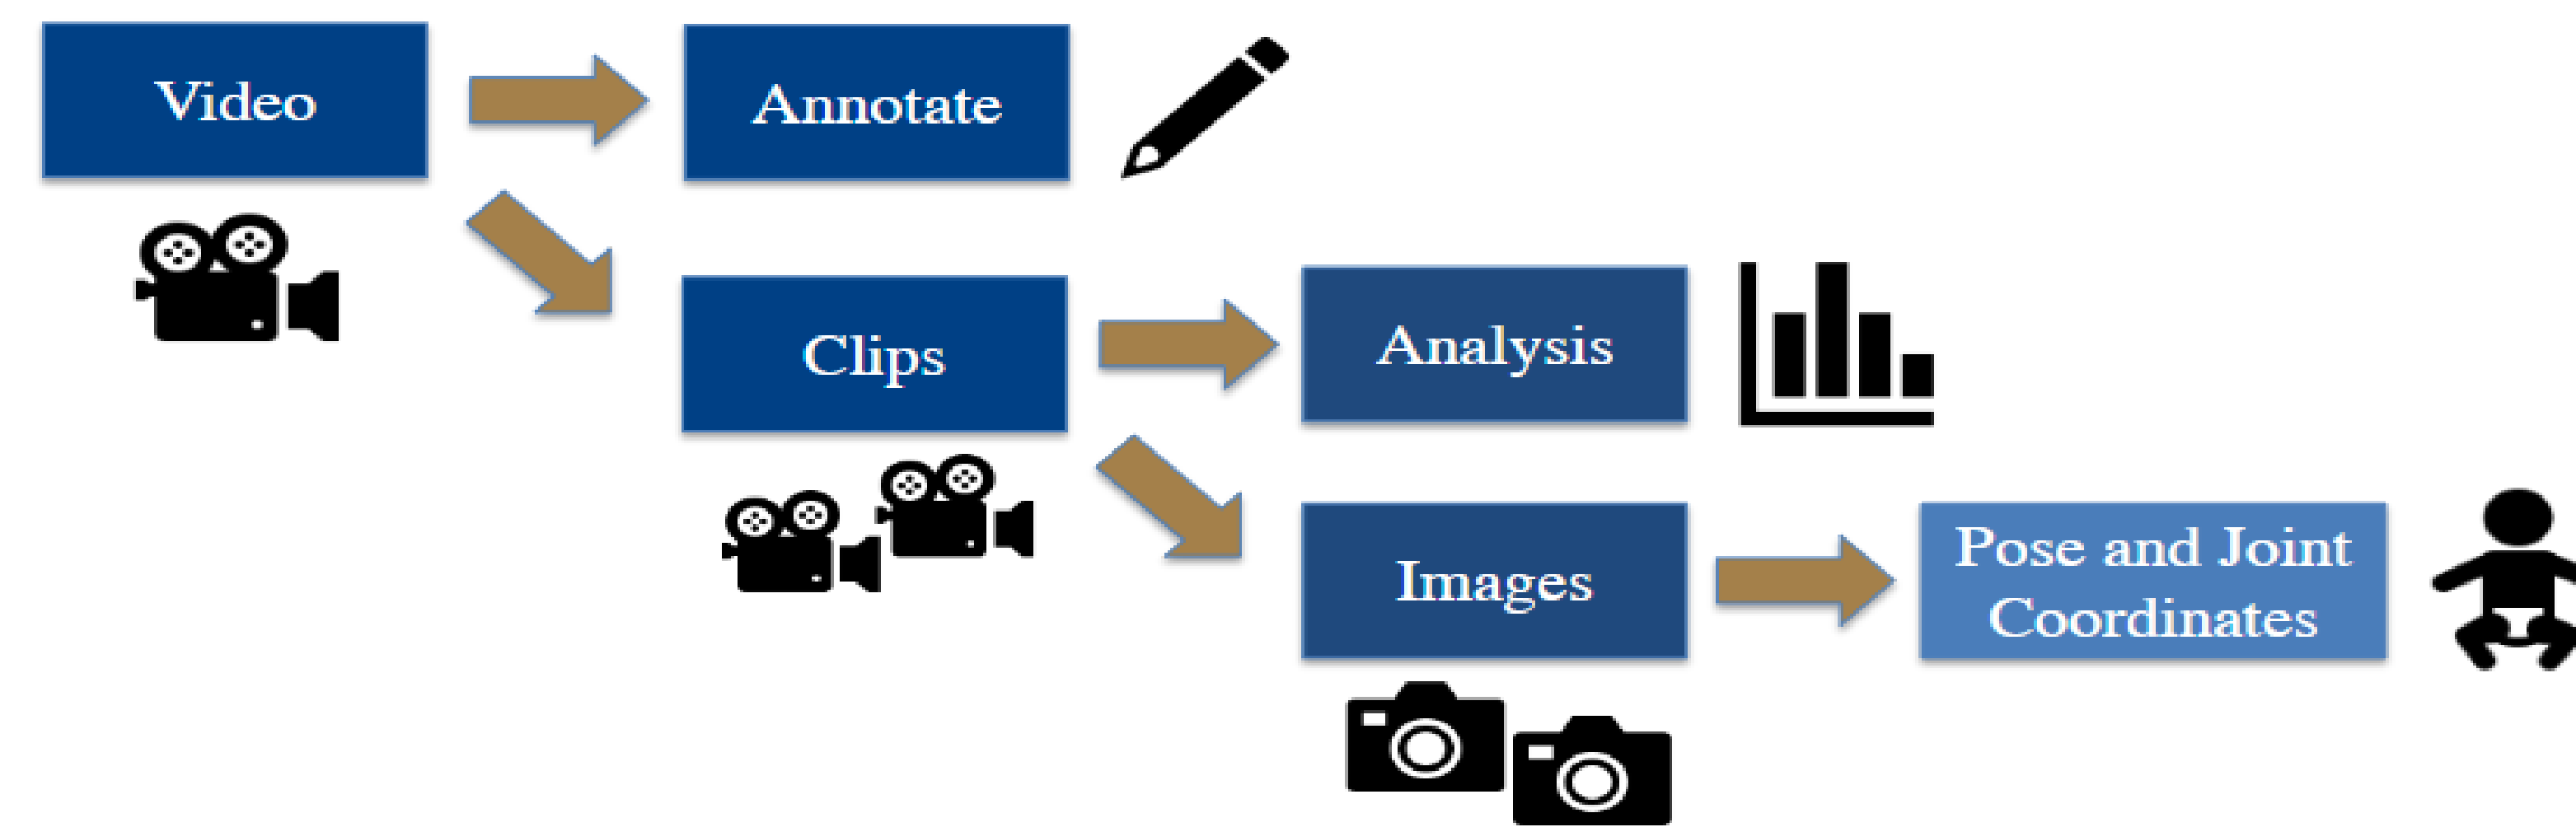

Results

• 40+ home videos 211 clips were annotated for infants reaching grasping and holding a ball.

Process of Data Collection

Before: Results

After:

MediaPipe Pose API

- Key body points
- Analyzes posture
- Categorizes action

Operating System for Computer Vision

- Analyze, verify and annotate the frame-by-frame action for the different motor functions displayed.

- Semi-automated code by Supervisely
- Evaluates classes, keys and tags

Outcomes

- Analyzed raw video data
- Developed deep learning techniques
- Supported the developmental assessment of infants
